When to Prune?

Late Winter-Early Spring

- This is the best time to prune most plants because it is before growth begins.
- Prune a few of the oldest canes from all mature shrubs down to the ground.
- Trim deciduous hedges wider at the base, narrower at the top.
- From dormant fruit trees remove weak, broken and crowded branches.
- Head back branches that have flower buds.
- In spring, prune evergreens of winter damaged wood and discoloured foliage.
- Avoid pruning frozen wood.

Plant	Instructions For Pruning
Apple	Prune moderately. Trim for low
	head. Keep main branches well
	spaced around tree.
Azalea	To renew old plants, fertilize well
	for one year. Then in spring,
	remove any damaged or
	overgrown canes.
Cherry	Prune moderately, lightly prune
	the most vigorous shoots.
Grape	Heavily prune old wood back to
	the main vine. Cut previous year's
	growth back to four or five buds.
Peach	Prune for low, ball-shaped top at a
	clean trunk. Vigorously prune one
	half of previous year's growth.
	Keep centre of tree open for good
	air circulation.

Pear	Prune lightly each year. Thin
	excess branches to encourage a
	spreading tree. Prune young tree
	to a central leader.
Plum	Prune moderately and a little each
	year at the crown to keep shoots
	coming on.
Barberry	Prune lightly after flowering to
	restore shape.
Elderberry	After fruiting, remove some of the
	oldest shoots at the ground, or cut
	back an old plant hard to force a
	new crop of canes.
Hydrangea	Prune Hills-of-Snow variety back to
	the ground. For other varieties,
	remove weak and dead growth
	and cut flowering stems back to
	two buds.
Roses	(Hybrid, Tea and Perpetual) After
	frosts, cut away dead and weak
	growth and shorten remaining
	canes to four or five buds.
Snowberry	Cut out old twiggy canes. Cut back
	last season's growth of remaining
	parts to three buds.

Late Spring-Early Summer

- This is the season of greatest growth.
- Remove some of the oldest canes of mature shrubs after flowering. Pinch out tips to encourage branching.
- Freely trim narrow-leaf evergreens of new growth.
- Remove dead flowers from broad-leaf evergreens to prevent formation of seed pods.
- Pinch any buds that may be starting unwanted growth.

Plant	Instructions For Pruning
Azalea	Prune for shape after all
	blooming has stopped.
Deutzia	Prune lightly to remove a few
	older branches and dead
	twigs after blooming has
	stopped.
Dogwood	After flowering, remove dead
	wood. Other types, prune
	dead wood only to preserve
	natural shape.
Forsythia	After flowering, remove a few
	older branches. For old,
	neglected plants, cut back
	entire plant to about one foot,
	leave three to five canes.
Honeysuckle	Cut some of the oldest wood
	to the ground every 4-5 years.
	Pinch shoots to encourage
	branching.

Mountain	Prune lightly. Pinch off
Laurel	clusters of spent blossoms.
	Remove a few old branches at
	the ground to induce new
	growth from roots.
Privet	In April, cut back hard to
	rejuvenate old plants.
Rhododendron	Same as Mount Laurel.
Roses	(Climbing) After flowering,
	prune one half of the old
	growth at the ground. Keep
	new shoots for next year's
	flowers.
Pine/Spruce	Cut back candles on side of
	branches of young trees to
	one half or less after needles
	have expanded but before
	hardening.

Summer

- Summer pruning entails removal of plant parts that are actively at work.
- Shear hedges regularly for appearance.
- Prune some lower branches from shade trees to develop clean trunks.
- Always be ready to pinch tips of leafy shoots, but not until after flowering.
- Limit pruning done late in the summer as new growth may be damaged by the coming low temperatures.

Plant	Instructions For Pruning
Apple	Prune to encourage good structure
	growth and support.
Blackberry	Cut back new shoots to
	approximately three and one half
	feet.
Crab-apple	Cut away weak internal shoots and
	crowded branches to a crotch. Thin
	out weeping and spreading forms to
	accentuate their growth patterns.
Holly	Prune any time of the year to restore
	shape.
Raspberry	Head back new canes to
	approximately 22 inches. Remove
	spent canes and excess shoots.
Roses	Prune lightly to shorten shoots only.
	Remove faded flowers (except for
	species roses).
Privet	Starting in June, trim to shape three
	times at six-week intervals.
Yew	Trim to maintain shape.
Wild	Prune very lightly. Trim lower
Cherry	branches and burn the wilted foliage.

Autumn-Winter

- Prune shade trees all winter for general shaping and to repair damage.
- Prune shrubs once more in September, especially to remove basal suckers.
- Avoid pruning evergreens.
- When removing heavy limbs, use proper safety procedures.

Plant	Instructions For Pruning
Honeysuckle	Remove gnarled and diseased
	old wood.
Mock Orange	Remove a few of the oldest
	canes every three to four years.
Peony	(Herbaceous) Cut to the ground
	as leaves mature and look dry.
Roses	(Tea and Hybrid) Lightly prune
	to prevent wind whipping and
	storm damage.
Fir	Use sharp tools to remove
	diseased or injured branches
	during very cold weather only.
